

Description

The separation amplifier of type family AD-TV 810 serves the galvanic separation, conversion and amplification of bipolar signal sizes. The very high frequency range allows direct current as well as alternating current transfers. Input, output and the supply voltage are galvanically separated from each other. The output signal is independent of the connected load up to a maximum value. The limit frequency of the amplifier can be set at the front as an option.

Application

Recording, galvanic 3-way separation, conversion and amplification of bipolar measuring sizes (voltage or current).

**Specific characteristics**

- 3dB bandwidth switch (0,1 / 0,5 / 1 / 2 / 20 kHz) are optionally available.
